# PSEUDO CODE

## DFS (Iterative Version)

**Input:** graph  $G = (V, E)$  in adjacency-list representation, and a vertex  $s \in V$ .

**Postcondition:** a vertex is reachable from  $s$  if and only if it is marked as “explored.”

---

mark all vertices as unexplored

$S :=$  a stack data structure, initialized with  $s$

**while**  $S$  is not empty **do**

    remove (“pop”) the vertex  $v$  from the front of  $S$

**if**  $v$  is unexplored **then**

        mark  $v$  as explored

**for** each edge  $(v, w)$  in  $v$ 's adjacency list **do**

            add (“push”)  $w$  to the front of  $S$

Complexity:  $O(V + E)$
